SUBJECT:

Is there any explanation in the text as to why the malfunctioning antenna is considered to be malfunctioning, in other words, is there any interpretation of figure 2 in the text? I don't know exactly how you read these charts, but in what seems to be the background one, I see a thing called azimuth angle in degrees and that is probably ok, but the one that says field strength is in db. Should that be dbm? I recall the dbm numbers that appear in the text get up in the 104, etc., and I recon also that antenna patterns are normally shown in db. Is this relationship spelled out in the text? Also in prior reports did we use the term azimuth ~~angle~~ angle in degrees? Did we use the same nomenclature in prior [] reports?
